                                                                                                                                                                            WPI: 94-135516/16.

New human monoclonal antibodies neutralising HIV - react with applied or applied mucloil acid desired; useful for in vivo or in vitro-diagnosis and for passive inmuno-therapy.

Example: Page 192-193: 245pp; English.
Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E-coli XLI Riue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gp120 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence R54320 neutralises HIVI

Claim 5: Page 188: 248pp; English.

Lymphocyte mRNA was converted to CDNA and subjected to PCR amphification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive closes. The light chain VK region sequence R54258 neutralises HIV1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 eltgspsslsasvgdrvtitcrasgsisnylnwyggkpgkapklliyaasslgrgvpsrf 60

Example, Fig 11, 366pp, English.

The sequences given in Wul261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAE's) which are immunoreactive with HIV glyroprofini gpl20 and are capable of monutalising HIV. This sequence represents the sequence of the JK4 gene clone, b8. A MAb containing this VL sequence has the capacity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Saps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2 BLIGSPSSLSAFVGDPVIIICHASQSISPNLNWYQQKPGTAPKVIIYAASSLQSGVPSRF 61

to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gpl20 preferentially over the precursor gpl60. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Blue cells were transformed with the library Filamentous phage were produced which expressed the MAD regions on their sufface. Panning with gp120 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence R54318 neutralises HIV1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 qspsslsasvgdrvtitcrasgtissylnwygqkpgkapklliyaasslgsgvpsrfsgg 60

Example: Fig 11: 366pp. English
The sequences given in W01261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoractive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, s4. A MAb containing this VL sequence has the capacity to reduce HIV infectivity time in an in vivo vivus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              l qspsslsasvgdrvtitcrasqtissylnwyqqkpgkapklliyaasslqsgvpsrtsgq 60

anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    binds mature gp120 preferentially over the precursor gp160. The may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ċ

  Claim 17.7 Fig. 2. Sequence comprises the light chain variable region (VL), TOGDE, obtained by light chain shuffling of the VL CLR3 of human carcinoembryonic antigen (NEA) specific antibody CEAS (see MU1985).

Specific antibody antigen binding member (A) comprises an NEA specific antibody antigen binding domain that has a dissociation constant for NCRA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferred in the non-cross-reactive with human liver cells, and preferred (A) include pairings of WH and VL sequences from CEA1-7 (see W1987-685), on their CDR sequences, mutageness from CEA1-7 (see W1986-95) obtained pairing mutagenesis or chain shuffling. An example of a claimed pairing
   0; Gaps
  Specific binding members for human carcinoembryonic antigen - bind to the A3-B3 extracellular domain of hCEA and are substantially non-cross-reactive with human liver cells, used for diagnosing
   is Tobb8 VL with CEA6 VH. (A) is used to detect cells expressing NCEA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast.

    Immunol. (1989) 142:3158-3163
    Structural and idictypic characterization of the L chains of
human IgM autoantibodies with different specificities.

  gene expressed in chronic lymphocytic leukemia with little or no somatic mutation. Implications for ethology and
   idues 1-129 ##label KIP
The protein is one of the surface immunoglobulin M autoantibodies expressed in patients with chronic lymphocytic leukemia.
  ##cross-references GDB:136266

##cross-references GDB:136266

An immunoglobulin heterotetramer subunit consists of two identical light (kappa or lambda) and two identical heuvy (alpha delta- epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into large:
  autoantibody; chronic lymphocytic leukemia; heterotetramer:

## ALIGNMENTS

```
DNA segments encoding monoclonal antibody - which binds to gp120 and neutralises HIV, for treating AIDS, and for diagnosing and monitoring HIV infection.

For anniholing HIV infections are secretarized to cDNA and this can man from the known hybridoma F105 was converted to cDNA and this subjected to F8 amplification using primars corresp. To appropriate commander of the heavy or light chains and having restriction sites to correct of the heavy or light chains and having restriction sites to command thuman monoclonal monitorial (AND) Hidds to a discontinuous epitate on the HIV gp120 evelope givelope givening to the binding of gp120 to the CD4 receptor, and neutralises a broad of finite finite sets immune. The restriction way be used to treat immune are general and sees of 0.1-10 mg/Kg.
                             OFFICE (First entry)

Example; Page 27-28; 36pp; English.

Blood samples were collected from patients immunised with allergens including ragweed (Ambrosia elator) extracts. The dominant allergen in cluding ragweed (Ambrosia elator) extracts. The dominant allergen in short ragweed is Amb a I. Purified PBLS were immortalised and then fused with mouse myloma cell line 553 and the resultant clones were screened using Amb a 1 protein. A single cell sublone AL 16-5.2, secreting Amb al-specific 164, kappa antibody was selected. Total spred. Brown the AL 16-5.2 cells and first strand cDNA was used as pred. Brown the AL 16-5.2 cells and first strand cDNA was used as the template, and the 5' and 3' kappa light chain primers (066540, 06541) were used in PCR and amplified band of the expected size was noted. The DNA sequence of several subclones config. this amplified DNA fragment was determined. The sequence and its deduced AA sequence are shown in 066538 and P<sup>5</sup>6.28; Comparison of the doduced C that the AL 16-5.2 L-chain sequence with human V region sequences indicates that the AL 16-5.2 L-chain is a member of the human VK III subgp. Sequence 325 BP. 73 B. 73 G. 74 I;

The nuclectide sequence of F10* VK (042707 · sequence differs from other F105 Vk sequence given elsewhere in the specification) was compared with germline gene Humwkil5 (04.2705), showing 97.78 similarity. By nucleotide sequence analysis, F105 appears to be defined from a member of the Vk III subgroup gene family.

Claim 4: Page 12: 18pp: Japanese.

Style-ray of 2: Progressor: The Immunosylobulin heavy and light that wariable regions isolated from peripheral blood lymphocyte strains of peripheral sequences were isolated from the RKR7 and 101-2 strains of peripheral blood lymphocytes of a Basedow's disease patient. These sequences are replaced. Geleted or inserted into an antibody, to create the antibodies of the invention The antibodies of the invention have thyroid function stimulating activity, and act by combining with thyrotropin receptor. The antibody can be used in a method to detect autoantibodies which have thyroid function stimulating activity.

This sequence represents the polony bragen.

This sequence represents the polony for anchoring of expressed proteins on the bacteriolage assembly process on a bacterial membrane protein. This the 40s residue minor phage assembly process on a bacterial membrane and accumulates on the inner membrane facing into the periplasm of E. Coli. This plasmid was remembrane facing into the periplasm of E. Coli. This plasmid was read within the screen of the innertion textress or a rectarial membrane facing into the periplasm of E. Coli. This plasmid was read within the screen of the innertion textress or a rations mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV 9512. Promes of the innertion textress of combinatorial Fab libraries. Prome consists of a DNA molecule having two cassettes to express one fusion protein. Fad'est in the cioning of combinatorial Fab libraries. Prome consists of a DNA molecule having two cassettes to express one fusion protein. Fad'est in the vector was designed for the cioning of large promeses.

Thinked 5' to 3' a first cassette consisting of large prometric (HES), a sequences and a store codon, a ribosome binding site (HES), a between the two cassettes, and a stop codon, a miscle sequence encoding between the two cassettes, and a stop codon, a Neal restriction sites, the tether sequence, the sequences encoding between the two cassettes, and a stop codon, a spacer region, a cloning region bordered by a stop codon, a stop codon will region bordered by separation control RBS, a PelB leader, a spacer region, a cloning region of second Not!

The protein region of the promession vector forms the basic centrol.
   The prombs expression vector forms the basic construct

This sequence represents the expression vector, pPho-TT which is a modified version of the phagemid expression vector, pComb3 given in 092546. pPho-TT provides for the expression of soluble Fabs which are secreted into the periplasmic space which is regulated from the alkaline phosphatase (phoA) promoter. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV gpl20. pPho-TT consists of a DNA molecule having two cassettes to express two soluble proteins a heavy chain and a light chain. The vector comprises, operatively linked 5 to 3, a first cassette consisting of the phoA
  cassette consisting of an expression control RBS, a PelB leader, a human consensus amino terminus spacer region comprising the sequence EVQLLE, a cloning region bendered by 5' Xhol and 3' Spel restriction sites followed by a Sfil site, expression control stop sequences and a Notl restriction site. The Pho-TT expression vector contains a light chain stuffer that is 1200 bp in length and a heavy chain stuffer that is 300 bp in length and a heavy chain stuffer that is sequences of the heavy and light
  binding site (RBS), an OmpA leader, a Sill restriction site, a spacer region, a cloning region bordered by 5' sacI and 3' Xbal restriction sites, an Ncol restriction site between the two cassettes, and a second

T15202 and T15203 are the heavy and light chain variable domains of a human anti-tetanus toxoid immunoglobulin (19) encoded by a Pecomb based expression vector. The heavy and light chain variable domains are used in an example to demonstrate the profin. Of antibodies for an antibody library using mutagenic primers. Mutagenic primers of the invention have sequences at their 3' and 5' ends both capable of binding different framework regions linked by a sequence 5 to 50 nucleotides long. Different immunoglobulins produced using the primers may be used to produce antibody libraries having diverse and

diversity antibody libraries, for screening antigens

Claim 21: Page 84-85; 120pp: English.

This sequence represents the light chain ocding sequence derived from
the surface display phagemid expression vector, pc3AP313. pc3AP313

Contains the bacteriophage gene III and heavy and light chain variable
domain sequences for encoding human Fab antibodies against tetanus toxin.

This sequence was pref. used in the method of the invention for the
production of antibody libraries containing increased diversity. The
sequences given in QV0480-08 are primers which were used for inducing
mutagenesis in a complementary determining region (CDR) of an
immunoglobulin light chain gene. These primers contain a 3' terminus
capable of hybridising to a first framework region and a nuclectide
sequence between the 5' and 3' termini having the formula [NNK],
where n is 3-4. These primers may be used to produce antibody
than the CDK regions of immunoglobulins heavy or light chains that
the library. These primers may be aged to produce antibody
the library. These primers filamentous phage particles comprising
the library. These primers prime mutate the light chain CDR3

The nucleotide sequence of F105 VK (042707 - sequence differs from other F105 Vk sequences given elsewhere in the specification) was compared with germline gene Hurvk225 (042705), showing 97 78 similarity. By nucleotide sequence analysis, F105 appears to be derived from a member of the VK III subgroup gene family. Sequence 390 BP. 115 C, 99 G, 88 T.

   Example 21: Fig 43: 196pp; English.

The V-kappa specific oligonucleotide 050327 was used to probe a human placental genomic ENA library cloned into lambdaEMBLE/SP6/17.

Bun placental genomic ENA library cloned into lambdaEMBLE/SP6/17.

Bun A fragments containing V-kappa segments from positive phage of lones were subcloned into plasmid vortors. Variable gene segments from the resulting clones were sequenced and functional clones were selected on the basis of open reading frames, intext donor and acceptor splice sites and intact recombination sequences. The sequences obtained from four different plasmid clones were designated p5 3, p55 5, p55 8 and p6. 15 (see Q44222.044225.

[1] and [2] claim that the majority of kappa mRNA (all V-region sequences from subsroups I and 3) is encoded by approximately 25 generaline V-region genes, and that the total number of human V-kappa genes is about 50 or less. Thus, somatic mutation may be the major source of human expea-chain diversity [2]. Compared in [1] and [2] with the subgroup V-kappa-1 germline V-region gene HKIOI.

  The nucleotide sequence of F105 VÅ (Q42707 - sequence differs from other F105 VK sequences given elsewhere in the specification) was compared with germline gene Humvk55 (Q42705), showing 97.7% similarity. By nucleotide sequence analysis, F105 appears to be derived from a member of the VK III subgroup gene family.

Human neutralising monoclonal antibodies to respiratory syncytial virus - for treatment prophylaxis and diagnosis of PSV and other diseases of the respiratory tract. Disclosure: Fig 4: 104pp: English.

The sequences given in R50215-19 represent the heavy and light chain variable domains of various clones of a human monoclonal antibody which binds to an epitype on alproprotein F of respiratory syncitial which binds to an epitype or alproprotein F of respiratory syncitial virus (RSV). These antibodies may be used as a reagent for the diagnosis of RSV disease and other viral mucosal diseases, eq.
   influenza virus, rhinovirus and coronavirus. They are particularly useful in ameliorating RSV when delivered directly to the lungs, and may also be used for treating pneumonia and bronchiolitis.

Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

Dassive immuno:therapy and detection of HIV infection.

The sequences given in W0120-24 represent the light chain variable regions (VH) of a series of antibody fragments (FAb's) which are immunoreactive with HIV glycoprotein gp41. This sequence represents the sequence of the clone, DL 4119. These sequences represent light chains which bind to the heavy light chain clones given in W01315-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vive viras infectivity assay by 50 % at a concentration of less than 700 ng of antibody/m1. The WAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.

   immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the IK2 gene clone, s6. A MAD containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gpl20 preferentially over the precursor gpl60. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.

Monoclonal antibody binding to VI/V2 loop of HIV gpl23 · used in passive immuno therapy and detection of HIV infection.

Example 3: Fig 19: 366pp; English.

The sequences given in W01320-24 represent the light chain variable regions (VH) of a series of antibody fragments (FAb's) which are immunoreactive with HIV glycoprotein gp41. This sequence represent infant chains which bind to the clone, GL 411. These sequences represent light chains which bind to the heavy light chain clones given in W0135-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml.

The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
